a) the first metallocene compound is selected from an *ansa*-metallocene having the following formula:

wherein (X¹) and (X²) are jointly selected from a fluorenyl and a cyclopentadienyl, a fluorenyl and an indenyl, or two fluorenyls, any one of which can be substituted, unsubstituted, partially saturated, or any combination thereof; or

wherein (X¹) and (X²) are jointly selected from two indenyls, any one of which can be substituted, unsubstituted, partially saturated, or any combination thereof;

wherein M¹ is selected from Ti, Zr, or Hf;

wherein (X¹) and (X²) are connected by a substituted or unsubstituted bridging group comprising:

- i) one atom selected from carbon, silicon, germanium, or tin, bonded to both (X¹) and (X²); or
- ii) two contiguous carbon atoms in a chain, one end of which is bonded to (X¹) and the other end of which is bonded to (X²); and

wherein (X³); (X⁴); each substituent on the substituted cyclopentadienyl, the substituted indenyl, and the substituted fluorenyl; and each substituent on the substituted bridging group is independently selected from a hydrocarbyl group, an aliphatic group, an aromatic group, a cyclic group, a combination of aliphatic and cyclic groups, an oxygen group, a sulfur group, a nitrogen group, a phosphorus group, an arsenic group, a carbon group, a silicon group, a germanium group, a tin group, a lead group, a boron group, an aluminum group, an inorganic group, an organometallic group, or a substituted derivative thereof, having from 1 to about 20 carbon atoms; a halide; or hydrogen;

b) the second metallocene compound is an *ansa*-metallocene having the following formula:

wherein M² is selected from Ti, Zr, or Hf;

wherein (X⁵) and (X⁶) are independently selected from a cyclopentadienyl or a substituted cyclopentadienyl;

wherein (X⁵) and (X⁶) are connected by a substituted or unsubstituted bridging group comprising:

- i) one atom selected from carbon, silicon, germanium, or tin, bonded to both (X⁵) and (X⁶); or
- ii) two contiguous carbon atoms in a chain, one end of which is bonded to (X⁵) and the other end of which is bonded to (X⁶); and

wherein when (X⁵) or (X⁶) is a substituted cyclopentadienyl, the substituted cyclopentadienyl is substituted with up to four substituents, in addition to the bridging group;

wherein (X⁷); (X⁸); each substituent on the substituted cyclopentadienyl; and each substituent on the substituted bridging group is independently selected from a hydrocarbyl group, an aliphatic group, an aromatic group, a cyclic group, a combination of aliphatic and cyclic groups, an oxygen group, a sulfur group, a nitrogen group, a phosphorus group, an arsenic group, a carbon group, a silicon group, a germanium group, a tin group, a lead group, a boron group, an aluminum group, an inorganic group, an organometallic group, or a substituted derivative thereof, having from 1 to about 20 carbon atoms; a halide; or hydrogen; and

c) the chemically-treated solid oxide comprises a solid oxide treated with an electron-withdrawing anion; and

d) the organoaluminum compound has the following formula:

wherein (X⁹) is a hydrocarbyl having from 1 to about 20 carbon atoms; (X¹⁰) is selected from alkoxide or aryloxy having from 1 to about 20 carbon atoms, halide, or hydride; and n is a number from 1 to 3, inclusive.
